

Living with Agents — Brand Architecture & Product Restructure

Owner: DigitalHustlerX (Marvel Ikpasa) **Status:** PROPOSAL — pending DV approval before anything goes live for real payments **Date:** 2026-08-11 **Scope:** Rebrands the Godseye ecosystem into a 3-page architecture + running binary (the "base agent"), a plugin marketplace, Telegram connectivity, referral links, and a storage/agents-file system.

1. The Three-Page Architecture

Page	Role	Where it lives
God's Eye	Main official product page	godseye.digitalhustlerx.com (existing godseye-repo SPA)
Living with Agents	Open-source community page	New /root/godseye-repo/living-with-agents/ (or hub/community) — this is where tips, hacks, and how-to content lives
Personal brand page	DV / DigitalHustlerX personal brand	digitalhustlerx.com hub / bio — personal face of the stack

Held up together. All three link to each other. The community page is the growth engine; the product page is the thing that monetizes; the personal page is the personality that drives trust.

2. The Product Model (what the community + product ship together)

The base offer is **a running agent the user can converse with the moment they create an account.**

2.1 Account flow (the "running agent" moment)

On account creation, the user is NOT handed a dashboard first. They are handed **a live, running agent they can talk to immediately**.

Auto-included with every account: - A running agent instance they can converse with. - Their **plugin** (the user's own agent plugin). - Their **LLM API keys** (the user can bring their own; or get cheap keys from us).

2.2 Referral links embedded in the flow

Two referral links are surfaced in the account/onboarding flow: 1. **OpenCode referral** — <https://opencode.ai/go?ref=PCC7NY4J9S> 2. **GLM referral** — (Z.AI / GLM-5.2) referral link

These are placed where the user configures their LLM keys. We resell cheap OpenCode keys and include our referral links into both.

2.3 Storage & the agents file

- **Storage, not inference**, is the sharing model. The agent's state/context stores where the user puts it.
- The system maps to an **"agents file"** that manages the user's **primary file**.
- Users can create **additional stores** where the system puts things.

(Implementation note: this is the data layer. We already manage customer design and operational files. The "agents file" = the config/state file that defines and manages their primary working file and any secondary stores.)

2.4 Telegram bot connection

- There is a **way for users to connect their own Telegram bots** so they can connect with the LLM through their own bot.
- This is a first-class connection, not an afterthought.

3. The Plugin Marketplace

3.1 What a plugin is

A **plugin** = a **directive to your LLM**. When you are plugged into the agents system, you can buy or install plugins that set up environments. Example: a plugin that sets up the **Telegram group**

environment.

3.2 Recommended plugins section

The marketplace has a "**Recommended plugins**" section at the top. Plugins here set a very affordable base price.

3.3 Scarcity model (curated store)

- The store is **curated by DV**.
- Stock is marked "**Coming soon**" — people cannot buy the plugin right now.
- This creates scarcity.
- Users get a **vanilla base agentic system** for free and can fast-track with plugins when available.

3.4 The vanilla base system

The default/free agentic system = **the Hermes open-source instance** (we use it ourselves). Its system is **recursive** — that's the property that makes it a strong base.

NOTE: "Hermes" (sometimes typed "Hemes"/"Hemis") = the Hermes Agent framework by Nous Research. When DV says a variant of "Hermes," it means Hermes Agent (the open-source instance we run). Never substitute a different product name.

4. Pricing Plan

IMPORTANT: Per brand rule, all figures below are a **PROPOSAL** until DV explicitly approves. Nothing gets embedded into live payment flows (Polar) without sign-off. The `mockData.ts` file is the single source of truth — change numbers there once and they propagate.

4.1 Current state (to be replaced)

The existing `mockData.ts` has WordPress-centric tiers: - Free \$0 (50 credits, 1 WP site) - Starter \$9 (500 credits, 1 WP site) - Pro \$29 (2,000 credits, 3 WP sites) - God Mode \$99 (10,000 credits, 10 WP sites) - Plus credit packs & a self-host matrix

Problem: too WordPress-first, credit-pile framing, doesn't reflect the running-agent + marketplace model.

4.2 Proposed model (REWRITE to this)

The offer should be framed as: **agent + connections + plugins**, not a pile of credits.

Tier	Price	What unlocks
Free (Vanilla Base)	\$0	The vanilla base agentic system (Hermes instance). Running agent via Telegram. Bring your own LLM keys or use shared cheap keys. Community support + curated plugin feed (view-only).
Base	PROPOSAL	Running agent + plugin marketplace access + Telegram bot connection + storage (agents file + primary store).
Pro	PROPOSAL	Multi-agent, multi-store, priority plugin library, recommended plugins unlocked, faster rate / more capacity.
God Mode	PROPOSAL	Everything unlimited, dedicated capacity, white-label, earliest plugin access.

Plus: **Plugin purchases** priced at an "affordable base price" (proposal) under **Recommended plugins**.

4.3 Numbers TBD (PENDING approval)

The specific dollar figures for Base / Pro / God Mode / base plugin price are **pending DV approval**. I will not guess-and-lock. Once approved, update `/root/godseye-repo/src/mockData.ts` .

5. Domain & Routing Plan

Current	Change
<code>godseye.digitalhustlerx.com</code>	stays = Main product page (reshape copy + marketplace + agent flow)
NEW community	"Living with Agents" community page — new folder + nginx server block (or integrate into hub/community)
<code>digitalhustlerx.com</code> hub	personal brand page (already exists, connect links)

Current	Change
g4.62.84.186.1.sslip.io	A/B variant staging — the pricing "between g4 and main domain" is reconciled in one place

6. Mandatory Reminders (brand rules)

- **Hermes** = Hermes Agent (Nous Research) open-source framework. That's the vanilla base.
- **OpenCode referral:** <https://opencode.ai/go?ref=PCC7NY4J9S>
- **Zero em dashes (—) in customer-facing copy.**
- **DigitalHustlerX** is the top umbrella. Godseye, Living with Agents, and the personal page all sit under it.
- **Payment processors are tools**, not partners/brands.
- Pricing = PROPOSAL until DV approves.

7. Open Decisions for DV (one reply)

1. **Approve or set** the Base / Pro / God Mode dollar figures + base plugin price.
2. Confirm the **community page location:** new subfolder under godseye-repo, or the existing hub/community.
3. Confirm the **domain** for Living with Agents community page.
4. Confirm GLM referral link value (I have OpenCode; need the GLM/DeepSeek referral).

Once these are set, I execute the build, deploy, and verify.
